

ABSTRACT

There is provided an antireflection film that can prevent the occurrence of interference fringes and, at the same time, has antistatic properties and excellent coating film adhesion. The first antireflection film comprises a transparent base material film 1 and, provided on the transparent base material film in the following order, an antistatic hardcoat layer 2-1 comprising an antistatic agent selected from polymeric antistatic agents, crosslinking group-containing low-molecular antistatic agents, and electrically conductive antistatic agents and having hard properties, and a low-refractive index layer 3 having a lower refractive index than an underlying layer in direct contact with the low-refractive index layer. The occurrence of interference fringes can be prevented by bringing the absolute value of the difference in refractive index between the transparent base material film 1 and the antistatic hardcoat layer 2-1 to not more than 0.03.
